

Pre-requisites

As a reminder, we expect that you:

- Already are experienced with R and have RStudio installed
- Have experience using Git and GitHub to make commits and push/pull code to GitHub

If you need a refresher for Git, consider looking at the Git refresher section of the workshop slides or the Intro to Git/GitHub workshop we have offered in the past:

<https://github.com/QLS-MiCM/IntroToGitHub>.

Acquiring the materials

Please head to this GitHub repository to either clone or download the materials:

<https://github.com/QLS-MiCM/RPackageDevelopment>

Note: consider making a fork of the repository to get the most out of the activities!

Installing Required Packages

Open the **RPackageDevelopment.Rproj** file to open the RStudio project in RStudio. From there, open the **WorkshopSetup.R** file to install all required packages for the session.

Selecting R projects

During the session, we will be working in different modules in the **Exercises/** folder. For each module, you will have to open the corresponding **.Rproj** files to change project and working directory in RStudio.

Example: If working on exercises in **Exercises/1_Simple_Scripts/**, you will have to open the **1_Simple_Scripts.Rproj** file in that folder to change your working directory in RStudio.
